Regular intergrowths of spinel and magnetite. O. M. Rimskaya-Korsakova (A. A. Zhdanov Gosudarst. Univ. Kifeldi Mineral., Leningrad). Zapiski Vsesoyuz. Mineral. Obschestva (Mém. soc. russe minéral.) 79, 178-90 (1950). A detailed microscopic description is given of the multiple regular intergrowth forms observed in magnetites, from which spinel was formed by ex-soln. By etching with HCl the spinel inclusions were isolated and the mineral character was detd. The n was 1.759-1.770 in deep-bottlegreen, 1.735-1.740 in the nearly colorless crystals. The darker spinel is pleonast, confirmed by chem. analyses. Brown-colored crystals are scarce, but often dark-brown, very fine-grained particles are observed in the cores of the bright spinels, which are high in MgO and Al₂O₃. In the exsolution process of the primary complex magnetite-spinel solid solution a typical ionic migration of Mg and Al to the exterior parts of the spinels took place. The induction effects of earlier unmixed products on the later exsoln. forms is also evident in the fact that often the spinel grains are grown on the early unmixed diopside inclusions. W. Etel

CH 8
Imitization of perovskite V. I. Lebedev and O. M.
Rimskaya-Korsakova *Doklady Akad. Nauk S.S.R.*
60, 237-240 (1977) The rare phenomenon of a replace-

ment of perovskite by ilmenite is described as a reaction combined with the change of magnetite in pyroxeite. It occurs in Buzovaya (Kharche). These are interesting because of their association with a brown-black phlogopite. The interspersed titanomagnetite is characterized by the intimate regular intergrowths of ilmenite on octahedron faces, and by spinel inclusions. The perovskite is somewhat younger than the Ti magnetite. The primary pyroxeite is intensely changed to a mixt. of light-green actinolite, phlogopite, and calcite. The phlogopite is characterized by an anomalous absorption similar to that of manganoptyllite, but no Mn was found in it. The microscopic examination in reflected light shows that the magnetite is often completely broken down to an aggregate of secondary minerals among which ilmenite is strikingly most stable. Sometimes a fracture is observed as a thin seam between the primary pyroxeite and the ilmenite.

Title : New Data Concerning Tungstenite

Orig Pub : Zap. Vses. mineralog. o-va, 1956, 85, No 3, 277-285

Abst : Report of a new discovery of the mineral tungstenite (I), hitherto known to occur only in one deposit (Emma, State of Utah). The described I was found in skarnic deposit Lyangar of western Uzbekistan, along contact zone of biotitic granites and a limestone-schist bed of Lower Paleozoic. Associated minerals: pyroxen, garnet, scheelite, pyrrhotine, chalcopyrite, sphalerite, molybdenite, pyrite and other. Chemical composition of I (in %): W 73.71, S 26.20, R₂O₃ 0.50, SiO₂ 0.10, total 100.51; by means of spectra were discovered in addition (in %):

✓ New data on tungstenite. O. M. Rimskaya-Korsakova and M. D. Tropinov (A. A. Zhukov, V. V. Gulyaev, L. M. grad). Zapiski Vsesoyuz. Mineralog. Obshchestva 85, 277-85 (1956). — The contact-metamorphic ore deposits of Lyungar (in western Uzbekistan) contain pseudomorphs of the rare mineral tungstenite (I) WS_2 after scheelite, $CaWO_4$. The occurrence is compared with that of the Emma Mine, Utah, where I occurs with pyrite, galena, tetrahedrite, and argentite. At Lyungar I is associated with scheelite, quartz, chalcopyrite, and calcite, in a silicified hedenbergite-skarn, in contact with biotite granite, and calcareous schists. The sulfide ores (molybdenite, sphalerite, etc.) are younger than the pyroxene and garnet of the skarn; hydrothermal quartz is a late crystall. product. The pseudomorphs of I after scheelite are usually incomplete (10 to 26 vol. % of I), with irregular replacement structures along cracks. The exterior scaly habit of the I is very similar to that of molybdenite, but its color is more lead-gray; $d = 7.18 \pm 0.05$ (pyrometer); synthetic WS_2 has 7.6; cell dimensions: $a = 3.151 \pm 0.004$; $c = 12.359 \pm 0.009$ kX. I is rather slowly changed by concd. HNO_3 to H_2WO_4 (molybdenite is rapidly oxidized). In reflected light I is white, with strong bireflectance, anisotropic, similar to molybdenite. Reactions for the distinction of I and molybdenite are described. Chem. analysis of I from Lyungar: W 73.71, S 26.20, Re_2O_7 0.50, SiO_2 0.10%. The spectrographic examn confirmed the presence of Fe, Si, Mg, Ag, Ca, Cu, Mn, and only traces of Mo. The incomplete pseudomorphs after scheelite showed in one analysis WS_2 40.9, $CaWO_4$ 35, $CaCO_3$ 21.9, FeS 2.2%. The genesis of the Lyungar I is that of a typical replacement phenomenon, by a reaction of the type $CaWO_4 + CO + 2H_2S \rightarrow WS_2 + CaCO_3 + 2H_2O$, under reducing, moderately high-hydrothermal conditions.

PURPOSE: This publication is intended for astronomers, geophysicists, astrophysicists, and other scientific personnel concerned with meteoritic phenomena.

CONTENTS: This is a collection of 12 articles on problems in meteoritics. Four articles describe the character of four different meteorites which fell on the USSR, and the conditions and phenomena accompanying their flight and fall. Four articles discuss the chemical and physical properties of meteorites and discusses the analytical techniques used in their study. Individual articles discuss African and international organizations for the study of meteorites. A catalog of Soviet and non-Soviet meteorites kept in the Department of Geology, Leningrad State University is presented. References accompany individual articles.

TITLE: Contribution to the theory of the locus of roots method of automatic control systems

SOURCE: AN BSSR. Vestsi. Seryya fizika-tehnichnykh navuk, no. 3, 1966, 109-119

TOPIC TAGS: automatic control system, automatic control design, conformal mapping, negative feedback

ABSTRACT: The author points out that whereas the locus of root method has been used for many years for the synthesis and analysis of automatic control systems, not much work has been done on the development of a general theory of the root loci. He therefore develops, on the basis of the method of conformal mapping, a general approach of root loci of different types. The transfer function of a closed automatic control system with derivative feedback is written in the form

$$W(p) = \frac{\varphi_r(p)}{\Phi_n(p) + K \Psi_m(p)} = \frac{G(p)}{1 + H(p)},$$

where

Card 1/2

ACC NR: AP6033070

$$H(p) = K \frac{b_0 p^m + b_1 p^{m-1} + \cdots + b_m}{a_0 p^n + a_1 p^{n-1} + \cdots + a_n} = K \frac{\Psi_m(p)}{\Phi_n(p)} \quad (n > m).$$

and the quantity

$$K = -\frac{\Phi_n(p)}{\Psi_m(p)} = f(p).$$

is mapped on the plane of the complex frequency variable p . The connection between this mapping and the root loci is established by determining the connection between the points of the p plane and the K plane in polynomial form. Formulas are then obtained with which to calculate the overall gain of the automatic control system for specified points of the root locus. A theorem is proved for the existence of a conformal mapping on the real axis of the K plane on the plane of the complex frequency variable p with the aid of a meromorphic function $K = f(p)$. The uniqueness of this mapping is also proved. It is proved further that the mapping of $K = f(p)$ on the p plane is the locus of roots and can be determined by certain criteria which are detailed. Other theorems concerning the conformal mapping are also proved. Orig. art. has: 2 figures and 42 formulas.

ABSTRACT: Considerable efforts have been made over the past three years in the Soviet Union to improve the training of workers in the more important jobs to enable them to make the fullest use of latest methods. These efforts are reviewed in the present article, in which a table is also given showing the absolute and relative numbers of steel melters with less than 1, 1-4, 5-10 and over 10 years experience for several works. In training, some works, e.g. imeni Voroshilova and Chelyabinsk, lag badly. Attention is drawn to the need for more basic and purely trade training.

1964, 51-56

TOPIC TAGS: residual stress, stress relaxation, rolling mill, ultrasound effect

TRANSLATION: For finishing of internal surfaces with open contours (cylinders having large openings and grooves), a full-contact rotational roller mandrel, whose length is equal to or somewhat longer than the length of the cylinder, was used. To remove the residual stresses originating in the rolling process, after machining the cylinders were subjected to ultrasound for 10 minutes at an operating frequency of 20 kc and ultrasonic power delivered to the vat of 1.25 kw. A rotational mandrel with radial feed insures obtaining openings of second-class accuracy and 8-10th class finish under the condition that the machining tolerance

Card 1/2

TITLE: Ultrasonic removal of stresses in parts after plastic deformation

26

SOURCE: AN BSSR. Fiziko-tehnicheskiy institut. Plastichnost' i obrabotka
metallov davleniyem (Plasticity and metal working by pressure). Minsk, Izd-vo
Nauka i tekhnika, 1964, 202-204

TOPIC TAGS: plastic deformation, ultrasonic treatment, reeling, stress elimination

ABSTRACT: The purpose of this article was to find a method for removing internal stresses after reeling cylinders so that the dimension of the cylinder remained constant after removing the enveloping ring, which is used to protect the opening in the cylinder skirt against distortion during reeling. The ultrasonic method was selected since the work-hardened surface of the cylinder opening after reeling was thermodynamically unstable and ultrasonic vibrations always promote the transition of metal from a thermodynamically unstable state to a more stable one by removing internal stresses. Twenty-two cylinders were reeled with enveloping

Card 1/2

L 39969-65

ACCESSION NR: AT5006713

rings on the skirt. After reeling, the inside diameter of the cylinder skirt was measured; then the rings were removed from 11 of these cylinders and the diameter was measured again. The other 11 cylinders were exposed to ultrasonic radiation for 10 min, after which the rings were removed from the cylinder skirts and the inside diameter measured. After reeling, the size of the cylinders at the place of the skirt with the enveloping rings had average deviations from the nominal size of 0.044-0.061 mm. The size changed (on the average by up to 0.078 mm) after removal of the ring. In the cylinders which were exposed to ultrasound and whose rings were then removed, the size decreased 0.024 mm. The authors therefore conclude that ultrasonic vibrations eliminate internal stresses after reeling. Orig. art. has: 1 table.

TITLE:

Identification of Particles in Nuclear Emulsions ¹⁹ Using
the Scale Method

PERIODICAL: Pribory i tekhnika eksperimenta, 1960, No.5, pp.20-23

TEXT: The method consists in the following. The track under investigation is examined through a microscope fitted with an eye-piece containing an eye-piece scale divided into equal sections of known length. When the scale is superimposed on the image of the track, some of the sections will be completely filled with grains, some will be only partly filled with grains and some will be empty (Fig.1). The track density is characterized by the number G of sections which are completely filled with the grains. The usual probability theory is used to determine the optimum cell size leading to the best resolution. Once the optimum size has been determined, the method is very convenient and rapid. The principle of the method was first suggested by Serebrennikov (Ref.1). Acknowledgments are made to N. A. Perfilov for his interest and discussions. There are 4 figures and 1 Soviet reference.

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1960,
Vol. 38, No. 5, pp. 1388 - 1398

TEXT: The present paper presents experimental investigations on the interaction of 930-Mev protons with emulsion nuclei, taking into particular consideration disintegrations with an emission of fragments with $Z \geq 3$. Particularly fine-grained emulsions of the type W-P(P-R) , prepared in the laboratory of N. A. Perfilov, were used for the experiments. The irradiation was performed on the proton synchrotron in Birmingham. Fig. 1 shows the sensitivity characteristic of the P-R emulsion (without sensitizing with triethanol amine). Particles with $Z = 1 - 3$ were identified by the "scale method" first used by Yu. I. Serebrennikov (Ref. 6). The disintegration events were divided into heavy and light emulsion nuclei according to

1) the charge sum of the particles in the disintegration ($\Sigma Z > 8$ - heavy nuclei), 2) the existence or nonexistence of recoil nuclei (existence - heavy nuclei), 3) the existence or nonexistence of short-range alpha particles ($< 50\mu$) or protons ($< 100\mu$) (existence - light nuclei). A total of 1054 stars with three or more prongs were analyzed, 905 of which were described as disintegrations of heavy nuclei and 149 of light nuclei. 11 events were established with two fragments having $12 > Z \geq 4$ with opposite directions of emission (8μ). These events, according to V. P. Shamov, are due to the disintegration of silver nuclei; of all stars with $Z \geq 4$ fragments about 5% were such. Fig. 2 shows the blackening distribution; Fig. 3 shows the distribution of $Z \geq 4$ fragment tracks with respect to their integral width. Figs. 4 and 5 show the relative probabilities of emission of $Z \geq 4$ fragments as a function of the particles participating in the disintegration at $E_p < 30$, ≥ 30 , and ≥ 100 Mev for Ag and Br nuclei. Fig. 6 shows the energy distribution of Li fragments in the disintegration of Ag and Br nuclei by 930-Mev and 6.2-Bev protons. Fig. 7 shows the distribution of solid angles between the fragments and the fast cascade particles. The numerical results for stars with three or more prongs are collected in a table.

TITLE: Study of the dependence of the angular distribution of photoelectrons on the γ -radiation energy

PERIODICAL: Akademiya nauk SSSR.. Izvestiya. Seriya fizicheskaya, v. 26, no. 9, 1962, 1169-1171

TEKT: Determinations were made of the angular distributions of K-photoelectrons knocked out from Ag, Nd, Bi, and U targets by Cs¹³⁷ γ -radiation, from Bi and U targets by Au¹⁹⁸ (412 kev) and Co⁶⁰ (1331 kev) γ -radiation (Fig. 1). From these, the dependence of the ratio I_0/I_{\max} on the nuclear charge number Z of the target (Fig. 2) and on the energy of the incident γ -quanta was derived. I_0 denotes the photoelectron intensity at $\theta = 0^\circ$ and I_{\max} is the intensity at the angle with the maximum photoelectron intensity. The photoelectron scattering in the target itself was calculated by the Monte Carlo method. The spectrometers used were

B125/B186

described among others by K. K. Aglintsev et al. (Izv. AN SSSR, Ser. fiz., 25, 1141 (1961)). The substances to be studied were sputtered onto colloid or aluminum backings. The angular distributions of an electron beam scattered in Bi layers (0.1; 0.2; and 0.4 mgcm⁻² thick) calculated by the Monte Carlo method are given in Fig. 4. These calculations were based on the formula $\cot(\theta/2) = Mv^2 p/Z'e^2$ (1) where θ is the deflection angle, M is the mass of the incident particle, v is its velocity, p is the collision parameter, e the electron charge; the Thomas-Fermi function $\phi(p)$ characterizes the weakening of the Coulomb interaction between nucleus and electron at a distance p from the nucleus owing to the screening of the nuclear field by the electrons. $Z' = Z\phi(p)$. The calculations give the quantitatively correct angular distribution and state the nature of its dependence on the nuclear charge number Z of the target nucleus and on the energy of the incident γ -quanta. The "anomalous" intensity I_0 is due to the term which is proportional to $(\alpha Z)^3$. The increasing deviation from Sauter's explanation of the photoelectric effect with increasing energy of γ -radiation is very interesting for the theory of the photoelectric effect. There are 4 figures.

AUTHORS: Rimskiy-Korsakov, A. A., Smirnov, V. V.

TITLE: Angular distribution of photoelectrons released by Cs¹³⁷ γ -rays from targets with various atomic numbers

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 42, no. 1, 1962, 67 - 68

TEXT: The angular distribution of photoelectrons knocked out of the K shell by Cs¹³⁷ γ -rays was investigated with a magnetic spectrometer (K. K. Aglntsev et al., Izv. AN SSSR, seriya fiz., 25, 1141, 1961). Thin targets and the good angular resolution of the apparatus made it possible to obtain the angular distribution in the photoeffect. Fig. 2 shows the change of the ratio I_0/I_{\max} (I_0 = intensity at the angle $\theta = 0^\circ$, I_{\max} = maximum intensity corresponding to the angle $\theta = 15^\circ$ for $h\nu = 662$ kev) with Z, Fig. 1 shows the angular distribution of K-photoelectrons released from Nd and U targets. The release of electrons at $\theta = 0^\circ$ is the most interesting deviation from F. Sauter's results (Zs. Physik, 11, 454, 1931).

Card 1/3

Angular distribution of...

33996

B125/B108

According to the empirical relation $I_0/I_{\max} = 2.59 \cdot 10^{-6} \cdot Z^{2.7}$ established by the authors, the intensity at $\theta = 0^\circ$ is caused by that term in the expansion which is proportional to $(\alpha Z)^3$. This is of interest for the theory of the photoeffect and will have to be studied quantitatively. Professor K. K. Aglintsev is thanked for his interest, M. N. Chubarov for assistance. Akust. Zh., Vol. 1, No. 2, 165-70 (1955). In Russian.

For an approximate evaluation of the nonlinear distortions in an electroacoustic path it is proposed to consider the transmitted signal as a stationary random process and to calculate its spectral density on leaving from its spectral density on entry, and from the nonlinearity characteristic of the path. The particular cases of "right-angled" and "bell" spectra are considered in some detail and expressions given for the spectral density of nonlinear products of 2nd-3rd and 2nd-5th orders respectively.

Title : Calculation of Audibility of Nonlinear Distortion, Occurring
in an Electroacoustic Channel.

Orig Pub : Akust. zh., 1958, 2, No 1, 51-61

Abstract : The audibility of nonlinear distortion is determined as a probability of the oscillations, which represent products of nonlinear distortion, will exceed the audibility threshold, raised as a result of the masking action of the fundamental transmission signal and of the noise in the auditorium. The theoretical estimate of this probability is made on the basis of the fact that the signal, transmitted by the electroacoustic channel, is considered as a random oscillation with a normal distribution of the instantaneous values, made up (in the case of music) of a large number of components with slowly-varying amplitudes. It is assumed that in

ABSTRACT: An International Conference on Structural and Space (Architectural) Acoustics, organized by the Institute of Electroacoustics and Structural Acoustics of the Technische Hochschule in Dresden, was held in Dresden on 5-9 September 1957. This conference was held under the leadership of the Institute Director, Prof.Dr.-Ing. V. Reichardt. Specialists from 12 countries took part in this conference. About 50 papers were read in five sessions devoted to methods of structural acoustic measurements, sound insulation, protection from vibrations, low-noise construction of transport equipment, noise in transport and industrial undertakings, planning of city building with noise abatement taken into account, problems of control of reverberation, measurement, calculation and control of sound reflection in rooms, diffusion of

ABSTRACT:

The Fourth Conference was held in Moscow from May 26 to June 4. It had been convened by the Komissiya po akustike i Akusticheskiy institut Akademii nauk SSSR (Commission for Acoustics and the Institute of Acoustics of the AS USSR) in conjunction with the Moscow State University. Almost 1000 participants assembled, among them delegates from Leningrad, Kiev, Lvov, Gor'kiy, Perm', Tashkent and other cities of the Soviet Union. The conference was also attended by acoustics experts from China, Poland, Czechoslovakia, Hungary, Rumania, the German Democratic Republic, Denmark and the United States. Approximately 180 reports were given at the Conference, amongst others by: A. S. Alekseyev and others on Methods of Determining Field Intensity and Propagation in Tubular Conductors; U. Ingard and Ts. Molling (both USA) on the Production of Sound

TITLE: Generation of sound in the collision of oxidizer and fuel gas jets

SOURCE: Akusticheskiy zhurnal, v. 10, no. 4, 1964, 444-449

TOPIC TAGS: combustion, combustion instability, gas jet

ABSTRACT: The generation of transverse oscillations in the combustion of a flat fuel-gas jet colliding with a flat countercurrently directed oxidizer gas jet was theoretically analyzed, and the following semiempirical formula was derived for calculating the period of flame pulsation (T):

$$T = 2t + \alpha\tau,$$

where t is the time traveled by the perturbation through the jet, τ is the burning time of a combustible element, and α is a constant

Card 1/3

L 1446-65

ACCESSION NR: AP4049295

which is empirically determined and depends on the fuel-oxidizer velocity and flow-rate ratios, the location of the point of collision, and the nozzle geometry. (The best results were obtained with $\alpha = 0.2-0.9$.) The value of τ is calculated from the formula:

$$\tau = w^{-1} [3/8\pi(Q_{20} + Q_{10})T]^{1/3},$$

where w is the normal burning velocity, and Q_{20} and Q_{10} are the fuel and oxidizer flow rates, respectively. The calculated and experimental relationships between T and the distance between the nozzles were in good agreement. The experimentally determined relationship between the pulsation frequency (60-260 cps) and the oxidizer velocity (0-8 m/sec) were also in good agreement with calculated data. At a constant fuel-oxidizer velocity ratio, the pulsation frequency increased with an increasing sum of the fuel and oxidizer velocities. It is concluded that the formula may be used for calculating the pulsation frequency in the combustion of impinging gas jets. Orig. art. has: 4 figures and 19 formulas.

AUTHOR:

TITLE: A theorem on the functions which are self-dual in the integral transformation of Hankel

PERIODICAL: Referativnyy zhurnal, Matematika, no. 12, 1961, 73, abstract 12B327. ("Tr. Vses. zhochn. energ. in-ta", 1960, vyp. 16, 61-67) ✓

TEXT: A function $f(t)$ is self-dual relative to the Hankel transformation if

$$f(t) = \int_0^\infty f(x) \sqrt{tx} J_\nu(tx) dx.$$

The class of such functions is denoted by R_ν .

The theorem is proved: If $\int_0^\infty e^{-px} f(x) dx = g(p)$,

$$x^{-(\nu+1/2)} f(x) \subset R_{\nu+1}, \nu \geq -1/2, \int_0^1 \frac{|f(x)|}{x} dx < \infty, \int_1^\infty x |f(x)| dx < \infty,$$

AUTHOR: Rimskiy-Korsakov, B.S.

TITLE: An Analogue of Poisson's Formula for Fourier's Cosine Transformations

PERIODICAL: Doklady Akademii nauk SSSR, 1960, Vol. 134, No. 5, pp. 1017-1020

TEXT: Let $F(n)$ be the number of the integer ideals with the norm n of the algebraic field \mathbb{Q} with the base number Δ of order $\chi = r_1 + 2r_2$ (r_1 the number of the real fields conjugate with \mathbb{Q} ; r_2 half the number of the imaginary conjugate fields). The author considers the rational field ($r_1=1, r_2=0$), the imaginary quadratic field ($r_1=0, r_2=1$) and the real quadratic field ($r_1=2, r_2=0$). The function $\frac{2}{\pi} L(x) = \frac{2}{\pi} L_{r_1, r_2}(x)$ which is

defined by

$$G(1-s) = \frac{\Gamma^{r_1}(\frac{s}{2}) \Gamma^{r_2}(s)}{\Gamma^{r_1}(\frac{1-s}{2}) \Gamma^{r_2}(1-s)} = \int_0^\infty \frac{2}{\pi} L(x) x^{s-1} dx, \quad 0 < \operatorname{Re}s < \frac{3}{4}$$

corresponds to each of these fields. The functions $\frac{2}{\pi} L_{r_1, r_2}(x)$ are Fourier

kernels.

Theorem: 1.) Let the function $\tilde{f}(s)$ of the complex variable $s = \sigma + it$ be regular in the strip $-\alpha_1 < \sigma < 1+\beta$ ($0 < \alpha_1 < 1$, $\beta > 0$) except in the point $s=0$, where it possesses a pole of first order. 2.) Let a $c > 0$ exist so that in the mentioned strip for $|t| \rightarrow \infty$ it holds $\tilde{f}'(s) = O(e^{-c|t|})$ uniformly with respect to σ . 3.) Let the finite boundary value $\lim_{s \rightarrow 0} \frac{\tilde{f}(s)}{s}$ exist. 4.) Let

$$f(x) = \frac{1}{2\pi i} \int_{1+\beta-i\infty}^{1+\beta+i\infty} \tilde{f}(s) x^{-s} ds, \quad x > 0. \text{ Then it holds}$$

$$(1) \sum_{n=1}^{\infty} F(n)f(nx) = R_0 + R_1 + \frac{1}{Ax} \sum_{n=1}^{\infty} F(n) \int_0^{\infty} f(t) \frac{2}{\pi} L(\frac{nt}{A^2x}) dt,$$

where $R_0 = \sum_{\Omega} (0) \lim_{s \rightarrow \infty} \{ s \tilde{f}(s) \}$, $R_1 = \frac{\tilde{f}(1)}{x} \lim_{s \rightarrow 1} \{ (s-1) \sum_{\Omega} (s) \}$, \sum_{Ω} Dedeckind
